

Stormwater Improvement

CHERI LANE STORMWATER IMPROVEMENT

SOLUTION

This project will provide a second stage of stormwater retention and treatment prior to the stormwater entering Pitts Bayou and St. Andrews Bay. It will better alleviate stormwater runoff in surrounding neighborhoods and alleviate continued unsafe living conditions in the structures on the flood site.

PROBLEM

This project consists of acquisition of Parker's primary flood-prone area and construction of a stormwater retention pond and treatment facilities, including culverts, drainage pipes and ditches.

This project dovetails with the recently completed project just north of this site that provides the first stage of retention and treatment. Buildings in the flood area are deteriorated and likely unsafe due to past and frequent flooding. Another level of stormwater treatment is needed to protect the surrounding waterbodies.
